Here's the fifth part of a series on Photoshop. This time, we'll take a look at the latest version of Photoshop, and how to use it to make graphic work for web, print or social media. You can read Part 2, Part 3, and Part 4 in the article series below. The basics of Photoshop One of the best things about Photoshop is that it allows you to make artistic works of various kinds. The basic forms of Photoshop work are as follows: The four software tools — Pen tool, Brush tool, Gradient tool, and Lasso tool — enable you to draw, edit, combine, and customize images and graphics. Note: In this tutorial, we'll start with Photoshop Elements, as it is easy to use and has all the basic tools. If you are working on the full Photoshop version, you can find a detailed guide of how to use Photoshop on that page, or check out all of our articles about Photoshop. Where to download You can download Photoshop and Photoshop Elements online at the Adobe website. You can purchase it from the Adobe store. Here's a brief description of the two versions: Photoshop Elements Adobe Photoshop Elements is a desktop photo editor and image-editing software. Q: Lost all idea of what scope I am working in Back in 2006 I did some work on a website that required me to write a function that would create the right kind of tables for my needs (searchable tables). I somehow implemented these in the beginning of this year and I don't remember ever touching the code. Now I want to create some new things, and I don't have a clue on how to correctly implement what I want. Is there a way to create a new object scope for these so that I can start playing around with my new code? PS: I don't have access to the project, only a copy of the files. So I can't directly ask for help. Also, I'm still a novice in programming. A: Well, I suppose you are looking for something like this. `var global = (function () { return { someVariable: "Locked", someFunction: function() { alert("World"); } }; }());` You'll need to modify it to make it "useful", but that's the general idea. I read in this thread that you can use a Paternoster altair to fly around the Muxoa peninsula on the south-west coast of Oahu. I've been on Maui, Kauai and Molokai before. Can you point me to an aerial map that shows the Muxoa peninsula? All I have is a Google street map, which I use regularly, but it isn't detailed enough for showing aerial images. Hi Bratfink, of course i am familiar with the paternoster, it's my primary method of transportation, since i have visited Maui many years ago i actually have been to the Muxoa peninsula. The image you are thinking about is actually a map of Olowalu, the district in which it is located, many years ago i created an aerial map of the whole county, which you can find on this page: (it's the top one that's orange, you can click on it). For the past six years, I have been living on Mau

Q: Regexp for this string has no groups I have this regexp `(?!(.+?))(.*)` with these arguments `String text = "[NAME], [ADDRESS], [EMAIL]"` What should i change in the regexp, to make it work? I need to catch all of these strings: `[NAME], [ADDRESS], [EMAIL]` They are separate tokens, but with different positions, but same number of words
A: It seems like you really want to "split by commas" so your regexp should be `(?!(^|,)+?)(,|(?!(^|,)+?))` Here are the steps: Capture the entire text inside the brackets. Match one or more characters that are not comma character followed by one or more commas, followed by one or more spaces, followed by a comma character, followed by a string of any characters. The reason you capture all of the white space inside of the brackets is to be able to insert it back in later. Note that the whitespace is inside of the brackets; it is treated as a character, but there really isn't any special meaning associated with it. Q: Move up to top of Screen How can I get the menu or the top bar to be on top of the screen? I want it to show at the top of the screen and to stay at the top even when the user uses the scroll bars. A: In the terminal you'd use this: `["S{1}"] || (echo "Usage: ${0} [submenu]");` to have your menu always appear on top of the screen. In any other application you might do: Win + tab but that works for only up to 3 objects at a time. Q: List down over multiple pages in CSS I have a web app with 5 pages that list people. I want the header to stay the same on each page, and the list items get smaller/go in the next line on each page as page content increases. So far I am adding a back to top arrow and `align-items: flex-start;` to get the section to stay in place at the top regardless of content
